APPLICATION RATES:

General Rates: 5-10 L/ha every 14-21 days.

Note: The minimum recommended water rate for foliar spraying is 350 L/ha.

WARNING - Application of calcium chloride almost always causes non-serious burn of leaf edges but severe leaf and fruit injury is possible under some conditions. To reduce the chance of severe injury, be careful not to exceed recommended rates. Do not apply the spray under wet, humid, or slow drying conditions. Spraying when temperatures are high may also produce injury. Although the safe upper temperature limit is not known, it is suggested that damage may occur at about 27°C. In hot weather, growers should apply the spray during the coolest part of the day.
